Sutra 7. Morphology: Words & Pieces of Words

Up until now we have been dealing with the ‘whole’ of Language, examining how it functions through the use of word-meanings in social communication. We are now going to dissect these smallest units of Language ‘live’ (word-meanings) and examine their parts, the bits and pieces of words, called morphemes. What are morphemes? How are they different from word-meanings, the smallest units of Language? What do they do? How do they form word-meanings, and how do we classify different kinds of morphemes? Let us now look for answers to these questions.

7.1 Morphology is the study of forms (morphs) which looks at the structural make-up of words. Morphology breaks the smallest unit of Language – word-meaning – into its meaningful parts, morphemes, and focuses on how languages build words out of them. This synthesis of morphemes into words is not haphazard – every language system has its own ‘word-building rules’ (just like they have sentence-building rules). It is the knowledge of these rules of synthesis that enables us to understand words that we have never heard before, and to create new ones.

Look at some unusual words and expressions, all from recent TV programmes – see if you can understand what they mean:

- **Growingly**, hotels are accommodating women travellers.
- Untangle, uncomplicate, unwind your life! (Use InTel technology! 😊)
- ‘We had some difficulty in operationalizing it with Turkey’ (Powell).
- A subwar between the Turks and the Kurds
- There is a risk of flood defences being overtopped by the surge
- They’d outfaxed all the reporters
- McCain had outraised Obama there
- Iran has conducted these in-your-face navy exercises in the Persian Gulf… Should we be worried about this warmupmanship?
- Techsperts (= tech experts)
- Obama certainly wowed the crowds in Strassburg
- Sharp-shooters on board ships would deincentivize the pirates
  (CNN,16/04/09)
- I had this is-it-really-happening-to-me kind of moment (words of a pirated sailor)

We are able to make sense of them, because they follow English word-building rules, unlike non-words like *runnity, *funner, *schoolship, *bigly, *shoppest, *tablable, *manling, etc.
What we have in our heads is the knowledge of the building-blocks (morphemes), and of how to put them together into words. We use morphological rules to build all kinds of words – simple, as well as complex ‘high-rise’ structures, made up of several levels (i.e., my mother-in-law’s house, George the 6th’s Throne, the editor-in-chief’s role, etc.). The output of one rule can be the input to another, or to itself. This enables us to create unlimited numbers of words without overloading our memory.

Morphological analysis helps us understand how we create brand-new word-meanings out of ‘bits and pieces’ of words. It explains why you ‘get’ the meaning of ‘insuperior’ or ‘downsizable’ and why it is that we can say

- Great → greatly, huge → hugely, but not big → bigly or red → redly;
- Laugh → laughable, but not smile → smilable;
- Eat → eatable, drink → drinkable, but not sip → sippable.

### 7.2 Words vs. Morphemes

Literally, the word ‘morpheme’ means an ‘element in a system of forms.’ They are ‘pieces’ of words that have meaning. Language works because we associate forms with meanings. A form can be any kind of physical structure. It is easy to think of the letters on a page as shapes or forms, but what about spoken words? Think of the sounds of ‘arm’ and ‘chair.’ The two words sound different, just as they look different when written down. From the point of view of our ears, these two words have different shapes, or forms. Each different form evokes a different meaning.

If we say ‘arm’ and ‘chair’ together, their meanings fuse into one word-meaning (armchair); the two ‘parts’ of ‘armchair’ are separate word-meanings, but together they fuse into a new word-meaning.

Yet, isn’t that what happens when we put words together in a sentence? Their meanings also blend into one chunk – meaning-as-use? Indeed; that is why Bhartrhari, the Indian scholar of the 7th century AD, regarded the whole sentence as a unit ‘conveying its meaning in a flash, just as a picture.’ If both morphemes and word-meanings are forms with meaning, then what’s the difference between them?

Word-meaning, as we remember, is the smallest unit of language that has all of its properties intact: each word-meaning is socialised thought in the form of sound; it exists in time and changes in use.

If words can be made up of any number of ‘meaningful pieces’ (as in down-to-earth, understatement, or multitasking, etc.), how do we know, then, when we
have a word? Bus stop, web site, power outage, mock exam – are these pairs of words, or just words?

Descriptive linguists define word as a **minimal free form**. This implies that it is a sound sequence which is **uninterruptible**¹ and **mobile** (i.e., banana cannot be interrupted – you cannot say, *ba-green-nana* or *bana-yummy-na*. The sequence *banana* can also freely move about in the sentence, as in:

- *This banana is green.*
- *Peter ate a banana.*
- *We use banana leaves to wrap mumu,* etc.

Words can be made up of one or of many morphemes. In fact, most long words in English can be broken down into smaller ‘pieces of meaning’. The longest word in English (according to Webster’s Unabridged Dictionary) contains 45 letters and can be broken down into 9 morphemes:

<table>
<thead>
<tr>
<th><strong>Pneumonoultramicroscopicsilicovolcanoconiosis</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>lung, respiration</td>
</tr>
</tbody>
</table>

*a a lung condition caused by the very small-looking particles of volcanic silicon dust*

**Morphemes** are different from words, because they are **not necessarily free**; many of them cannot stand on their own, and only acquire their meaning when fused together with other morphemes. Look, for example, at the –s morpheme, which can mean the plural of a noun or the 3rd person singular form of the verb:

- 1 apple → 7 apples (books, thought$s$, etc.)
- They read → She reads, looks, thinks, etc.

By itself, the sound [s] has NO meaning! That is why **morpheme** is often defined as a “**minimal unit of meaning or grammatical function**” (Yule: 1998).

Grammatical meaning is more abstract than concrete lexical meaning; i.e., compare the meaning of ‘go’ in ‘I’m going to Lae’ and its more abstract meaning (intentional future action) in ‘I’m going to do it’; and ‘have’ in ‘I have a car’ (possession) and ‘I have seen it’ (completed action), etc. The more general way of putting it, then, will be:

**Morphemes are minimal units of meaning**

¹ This ‘uninterruptibility’ principle is challenged by ‘**infixes**’ (i.e., *a-whole-nother* matter, etc.; these are rare in English, but quite common in many other languages – Re: 7.4)
This definition is ‘stretchable’: it covers all kinds of forms (free and not free/bound, sound / visual), and all kinds of meaning (concrete, as well as the more abstract grammatical meanings).

7.2.1 Recognising Morphemes
In theory, there is no limit on the number of morphemes in a word. It is only our breath and memory that limit their number!

Linguists identify morphemes by comparing many utterances and looking for sequences which are partially the same. For example:

<table>
<thead>
<tr>
<th>The</th>
<th>anti-war</th>
<th>frog</th>
<th>croak-ed</th>
<th>tender-ly</th>
<th>and</th>
<th>jump-ed</th>
<th>for-wards</th>
</tr>
</thead>
<tbody>
<tr>
<td>The</td>
<td>pro-choice</td>
<td>chicken</td>
<td>squawk-ed</td>
<td>loud-ly</td>
<td>and</td>
<td>strutt-ed</td>
<td>back-wards</td>
</tr>
</tbody>
</table>

Partial similarity between these sequences enables us to isolate sequences -ed, -ly, and -wards, as well as ‘the’ and ‘and’.

In Turkish, partial similarity between adamlar and kadinlar enables us to isolate the plural suffix: ‘-lar,’ and the words adam (man) and kadin (woman).

In Swahili, the overlap between nitasoma (I will read); nilisoma (I read – past tense); utasoma (you will read); ulisoma (you read – past tense) enables us to identify soma ‘read’; ni ‘I’; u ‘you’; ta (future tense); and li (past tense).

Not all morphemes are as easily ‘segmentable’ as these examples, but the identification of morphemes is done wholly by means of this basic technique of isolation through the comparison of partially similar sequences.

7.3 Characteristics of Morphemes
Morphemes have four defining characteristics:

(a) They cannot be subdivided
(b) They add meaning to a word
(c) They can appear in many different words
(d) They can have any number of syllables.

Let us look at each of these features:

(a) Morphemes cannot be subdivided
By definition, morphemes are the smallest meaningful forms of language. If you try to divide a morpheme into smaller pieces, all you will get are sounds. The individual sounds of language do not have a meaning by themselves – they have to be combined with other sounds before they have meaning. For
example, we can break the morpheme ‘cat’ into its component sounds (/k/, /æ/, and /t/), but none of them by themselves convey any meaning. They all have to be put together – in just the right order – to create the meaning ‘feline animal.’ If arranged differently, they would create other meanings: [æk], or [tæk]. These patterns of sounds convey different meanings and therefore they make up different morphemes.

(b) Morphemes add meaning to a word
Each morpheme contributes to the overall meaning of the word, but not in equal measure – some affect the overall meaning more than others. In your opinion, which morphemes have more effect on the overall word meaning in the examples below?

<table>
<thead>
<tr>
<th>arm + chair = armchair</th>
<th>arm + s = arms</th>
<th>chair + s = chairs</th>
</tr>
</thead>
<tbody>
<tr>
<td>tool + bar = toolbar</td>
<td>tool + s = tools</td>
<td>bar + s = bars</td>
</tr>
<tr>
<td>gate + way = gateway</td>
<td>gate + s = gates</td>
<td>way + s = ways</td>
</tr>
<tr>
<td>school + girl = schoolgirl</td>
<td>school + s = schools</td>
<td>girl + s = girls</td>
</tr>
<tr>
<td>sea + horse = seahorse</td>
<td>sea + s = seas</td>
<td>horse + s = horses</td>
</tr>
</tbody>
</table>

(c) Morphemes can appear in many different words
Morphemes are recyclable. If you know the meaning of the morphemes, you can ‘crack’ the meanings of even unfamiliar words quite easily, because the same morphemes show up over and over again in many different words. Once you’ve learnt the meaning of a morpheme and the knack of spotting it in slightly different forms, you’ll know something about all the words that use it. Take, for example, the Latin morpheme *duc* (lead, draw, pull) - look at some words that use it:

reduce ‘to pull back’; deduce ‘to draw away from’
seduce ‘to lead apart’; produce ‘to pull forward’
induce ‘to lead into’; conduct ‘to lead together’

Another example is *ped* ‘foot’ – also from Latin:

pedal ‘pertaining to the foot’
pedestrian ‘one who uses his/her feet for transportation’
pedigree < Old French pied de grue, or Crane’s Foot
biped a creature with two feet
expedite ‘to free the feet’ = to speed up progress
impede to have something in the way of one’s foot (to slow down)

(d) Morphemes can have any number of syllables - they are NOT syllables:

A syllable is a unit of sound; a morpheme is a unit of meaning.
Some morphemes have several syllables, i.e., ‘hurricane,’ ‘banana,’ ‘tornado,’ while others don’t even form a syllable: cats = 2 morphemes, cats’ = 3 morphemes in a single syllable! Although possessive [’] is shown in writing, it is not even pronounced! However, the morpheme clearly exists in that word, because the words cats and cats’ have different meanings (that apostrophe adds the meaning of possession).

Syllables may even divide one morpheme. For example, the word ‘pregnant’ has three morphemes, but only two syllables:

pre- / gn / -ant
‘b/4’ ‘birth’ ‘one who’ – literally, ‘one who is before giving birth’

Compare to the number of syllables: preg + nant. The morpheme gn is split in half by the syllable structure of the word dictated by the ‘gravitational pull’ of the vowels.

7.4 Classification of Morphemes
The words of language – any language – often consist of a number of elements. For example, English word-forms such as cools, cooler, coolest, coolers, cooled, cooling, pre-cooled, and uncool are made up of one element cool, and a number of other elements such as -s, -er, -est, [-er + -s], -ed, -ing, pre-, and un-. All of them are morphemes (minimal units of meaning). The ‘common denominator’ between related words (i.e., cool) is called the stem; the other morphemes attached to it are called affixes. Affixes that come before the stem are called prefixes; affixes that come after the stem are called suffixes; affixes that are inserted into the stem are called infixes.2

Free and bound morphemes
Some stems (such as cool, teach, etc.) can stand by themselves as single words; they are called free morphemes.

All affixes, as the name suggests, must be fixed (or attached) to a stem; they are the bound morphemes which cannot normally stand alone, e.g. anti-capitalist, pro-choice, worked, happily, songs, singer, sleepless, etc. They cannot stand on their own and only make sense in combination with the stem.

Bound morphemes are of two main kinds: inflectional and derivational. The difference between them is that inflectional bound morphemes simply inflect (modify) the form of the same word, to make it fit in with the other words in

---

2 Infixed are rare in English, but quite common in some Austronesian languages
the sentence, whereas *derivational bound morphemes* create an entirely new word, related to (or ‘derived’ from) the original one. Look at this sentence:

*The old dog yawned and winked slyly at the helpless and sleepy bat.*

All four underlined words seem to have similar structures, consisting of a free morpheme followed by a bound morpheme. Yet the bound morphemes are different in what they do:

⇒ *-ed* simply indicates that the actions verbs name (to yawn/wink) happened in the past; the morpheme *-ed modifies* the meaning of the same words, whereas

⇒ *-ly, -less* and *–y* created new words, which behave in the sentence quite differently from the original words.

In order to get the overall picture, let us now draw a ‘family tree’ of the different kinds of morphemes. They fall into two main groups – **free** and **bound**:

**Free morphemes** can be

1. **Lexical**: those that by themselves represent independent concrete concepts (lexical morphemes are called an ‘open’ class of words, because we coin new words all the time, to refer to new concepts, i.e., blog, download, PMV, etc.)

or

2. **Functional**: function words, like auxiliary and modal verbs, conjunctions, prepositions, pronouns, and articles. Because we almost never add new functional morphemes to the language, we call them a ‘closed’ class of words.

**Bound morphemes** may be

(a) **Derivational** (if they create a new word) or

(b) **Inflectional** (if they create just another syntactic form of the same word).
Inflectional morphemes never change the grammatical category of a word.

For example, both *old* and *older* are adjectives. The –*er* inflection simply creates a different version of the adjective (comparative).

Derivational morphemes can change the grammatical category of a word.

The verb *read* becomes the noun *reader* if we add the derivational morpheme -*er*. So, the suffix form –*er* is an inflectional morpheme in adjectives, and derivational in nouns. These bound morphemes may look like identical twins (-*er* : -*er*), but that doesn't mean that they act the same.

7.5 Morphological Description

Now that we know the different types of morphemes, we can break most English words into their ‘elements,’ and name them appropriately.

Take, for example, the sentence ‘The company's management sacked the workers’:

*The company - 's manage -ment sack -ed the work -er - s.*

(functional) (lexical) (inflectional) (lexical) (derivational) (lexical) (inflect.) (funct.) (lexical) (derivational) (inflectional)

Problems in Morphological Description

Nothing is always so ‘black and white,’ though – what, for example, is the ‘plural morpheme’ in *sheep, men, mice, geese, or deer?* And what about the inflection of *go* into *went, be* into *am/ is/ are* and *was/ were, or good* into *better/ best* and *bad* into *worse/ worst?*

We shall look at all these and other interesting cases in the next unit, dealing with variation in the forms of morphemes, or allomorphy. Right now, let us look at how we use morphemes to build word-meanings. A brief look at the structure of English words will give us an idea of the general principles of word formation.
7.6 Principles of English Word Structure

Two different types of morphemes – stems (or roots) and affixes – act as building blocks that make up English words. Each of these classes can be further subdivided:

- **Roots** can be **free** or **bound**
- **Affixes** (bound morphemes by definition) can be divided into prefixes and suffixes.

<table>
<thead>
<tr>
<th>MORPHEMES</th>
<th>STEMS/ ROOTS</th>
<th>AFFIXES</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Free Roots</td>
<td>Prefixes</td>
</tr>
<tr>
<td></td>
<td>Bound Roots</td>
<td>Suffixes</td>
</tr>
</tbody>
</table>

Roots and affixes affect both meaning and structure (form) of a word in very different ways – let us take a closer look at the behaviour of these two classes of morphemes.

**Stems/ Roots & Affixes**

**Stem** (or **root**) is the basic morpheme to which other morphemes (typically, affixes) are added. (A root is always unanalysable, or monomorphemic).

**Stems** differ from **affixes** in two ways:

### # 1: Stems usually have a specific meaning, which tends to be relatively constant across all the words that use the root. Stems also contribute the greatest conceptual content to the overall meaning of the word. Since roots are doing most of the work of conveying meaning, they are indispensable word elements: every word has at least one root. For example, **pter** is a root meaning ‘wing’. It appears in words like:

- *pterodactyl* ‘wing-fingers’
- *helicopter* ‘spiral wing’
- *apterous* ‘lacking wings’

The form **pter** retains the specific meaning ‘wing’ in each word. Also, the meaning ‘wing’ is the central part of the overall meaning of the word.

**Affixes** are morphemes which attach to roots or a combination of roots and other affixes. They modify the meaning of the root(s), but do not change it completely.
Remember our examples with ‘sea’ + ‘horse’ = ‘seahorse,’ as opposed to ‘sea’ + ‘-s’ = ‘seas,’ and ‘horse’ + ‘-s’ = ‘horses’?

Now consider the affix pro- meaning ‘before, for, forward’ in words like:

- **propel** ‘to push forward’
- **pronoun** ‘substituting for a noun’
- **prologue** ‘something spoken before (something else)’

Although the different senses of pro- are clearly related, the exact meaning shifts somewhat from word to word. As a rule, affix meanings tend to be more vague, and more variable, than root meanings. Learning to deal with the ‘shiftiness’ of affixes is an important skill in word analysis.

**# 2: Stems have freer distribution**, i.e., they can occur almost anywhere in the word. Look back at the examples we just discussed: we find pter at the beginning, in the middle, and at the end of the word. Affixes, on the other hand, are restricted to certain positions within a word. **Pro-** (as in pro-choice) is a **prefix**, and so must always come before the stem.

**Types of Stems**

**Free Stems** can occur by themselves, as whole words. Many native words, such as **blue** and **berry**, are free roots, because they can stand alone as single words. Free stems can also combine with other roots or affixes to form more complex words, as **blueberry** and **bluish**. Some other examples of **free stems**:

- un+**happi**+ness
- walk+ed
- eat+er+y
- pre+**cook**
- winter+ize

**Bound Stems** can never occur alone as whole words. For example, the roots **cran** and **fer** cannot stand alone; they must occur in combination with other morphemes, such as **cranberry** or **transfer**. Other examples of **bound stems/roots**:

- re+**fer**
- in+**fer**
- pre+**fer**
- de+**fer**
- con+**fer**
- re+ceiv**e**
- de+ceiv**e**
- con+ceiv**e**
- per+ceiv**e**
- phob+i**a**
- phob-i**c**, etc.

**Compounds** are words constructed from two or more roots (they may or may not have affixes):

- **blackberry** a compound of two free roots
- **anthropology** a compound of two bound roots
Types of Affixes

**Affixes by definition are always bound**, or ‘affixed’ to a root. They fall into two groups, depending on where they attach to the root:

- **Prefixes** occur before a root (although several prefixes can be strung together before a single root): \textit{dis}+\textit{in}+\textit{fect}+\textit{ant}, \textit{in}+\textit{dis}+\textit{crimin}+\textit{ate}, etc.

- **Suffixes** occur after a root (multiple suffixes can also occur at the ends of words), i.e., \textit{un}+\textit{believ}+\textit{abil}+\textit{ity}, \textit{pre}+\textit{par}+\textit{at}+\textit{ion}+\textit{s}, \textit{un}+\textit{pre}+\textit{dict}+\textit{abil}+\textit{ity}, etc.

**Infix**: The third group of affixes, **infixes**, may be whole words *embedded in the root*. They are rare in standard English and occur mostly in conversational/vulgar speech):

\textit{un}+\textit{frigging}+believable \quad \textit{abso}+\textit{bloomin}’+lutely \quad \textit{fan}+\textit{bloody}+tastic, etc.

Some other languages use **infixes** routinely, for example, in **Bontoc** (Philippines):

- \textit{fikas} ‘strong’ \quad \textit{fumikas} ‘to be strong’
- \textit{kilad} ‘red’ \quad \textit{kumilad} ‘to be red’
- \textit{fusul} ‘enemy’ \quad \textit{fumusul} ‘to be an enemy’

**Circumfix**: We can see just how amazingly diverse human languages are in yet another type of affixes: **circumfix**. As the name suggests, it ‘surrounds’ the root – part of it precedes the root, and part of it follows it. In the **Chicasaw** language (Oklahoma),

- \textit{chokm-a} \rightarrow ‘he is good’ \quad \textit{ik-chokm-o} \rightarrow ‘he isn’t good’
- \textit{lakn-a} \rightarrow ‘it is yellow’ \quad \textit{ik-lakn-o} \rightarrow ‘it isn’t yellow’

7.7 Creating new words: Some General Word Formation Processes

New words appear in our lexicon all the time – people make them up to reflect new concepts and realities. One of the relatively recent developments, for example, is amateur journalism on the net – people write on issues they feel strongly about and post their thoughts and comments on their web pages (in itself a new concept 😎). They are **bloggers**, or ‘web loggers’; where did the name come from? You know the word for an official written record of events during a ship’s voyage, or an aircraft’s flight – ‘\textit{log}’, also ‘logbook’ – ‘a detailed record of things done, experienced, etc., as in ‘keep a logbook’? That is exactly what bloggers do – they give a detailed written account of their experiences.
and thoughts, and post them on the web – that is why their writings are called *weblogs / blogs*, their occupation – *weblogging / blogging*, etc. We have no trouble in understanding all those derivative words – why, do you think?

Take *morphing*, for example. According to the Collins Gem Computer Jargon list, it is the technique of blending one image smoothly into another to create a radical transformation. Now, would you be confused, if you heard of a bear being *morphed* into a cat, or of *morphing software*, which brings such effects to the average computer? I guess even ‘*morphers*’ is possible… I have also heard people talking recently about *rascality*, and having been *rascalled*… Although you, like me, may not have heard some of these terms before, we ‘catch on’ with no problem – why so?

We can understand new words and form new ones, because we know the rules of word formation in the language that we use. These are the so-called morphological rules that we have in our heads – they determine the grammaticality of the words we produce. We have already discussed derivational suffixes and prefixes that we use to form new words. Let us quickly revise those, and focus on some other basic ways in which new words are made. Here is a list and a brief discussion of the general word formation processes, which include:

- Derivation
- Compounding
- Blending
- Clipping
- Backformation
- Conversion
- Acronyms
- Analogy
- Coinage
- Reduplication
- Multiple processes
- Borrowing

You remember that *affixes* (all *bound morphemes*) are used to ‘*add*’ meaning to *word roots*. We also remember that affixes fall into two main groups*:

- *prefixes*, that come *before* the root, and
- *suffixes*, that come after the root

*Infixes* are not common in English and *circumfixes* are simply not there!

We also remember that the ‘*kind*’ and ‘*amount*’ of meaning that these bound morphemes add to the roots depends on the kind of affix:
⇒ **prefixes** and **derivational suffixes** change the overall meaning of the word, they help us form **new words**, whereas
⇒ **inflectional suffixes** add only **grammatical meaning** that helps us understand the relationships between words in a sentence, but they do not change the core meaning of the word.

English prefixes and derivational suffixes come from a variety of source languages, including Old French, Latin and Greek.

Affixes, whose meaning is obvious to the average English speaker (i.e., *un-* clean, or fear/-*less*, etc.), are sometimes called **productive**, whereas the more obscure ones, whose meaning is not immediately obvious, are called **unproductive**. Why? Because the average English speaker, without the knowledge of classical Latin or Greek, would not know their meanings and, consequently, will not use them to form new words. Here is

A Selected List of Some Common (‘Productive’) English Affixes:

- **after**- from the Old English preposition, giving compound nouns like *afternoon*, *afterbirth*, *afterlife*, *afterthought*, *aftermath*, *after-effects*, etc. A wide range of adjectives is also possible: *after-school*, *after-work*, *after-dinner*, *after-hours*, etc. (The adjectives usually take a hyphen, the nouns don’t).
- **by**- from OE ‘by,’ giving compounds like *bystander*, *bypass*, *bygones*, etc.
- **dis**- /dif- /di- from Latin ‘apart’ or ‘another’: this prefix can elide (‘fuse’) with other consonants, giving words like *diffuse*, *divide*, *differ*. More importantly, it also combines with many existing verbs to give their opposites: *disagree*, *disappear*, *disapprove*, *dissociate*, *disconnect*, *disengage*, *disinfect*, *dislike*, *dilodge*, *disobey*, etc.
- **double**- from Old French meaning ‘two,’ as in *double-glazing*, *double-locked*, *double-sided*, *double-jointed*, *double Dutch*, *double Scotch*, etc. There is also a meaning of deception in compounds like *double-dealing*, *double-talk*, *double-cross*, etc.
- **down**- from OE, giving compounds like *downfall*, *downcast*, *downbeat*, *downturn*, *downgrade*, as well as vogue terms like *downsize*, *downturn*, etc.
- **ex**- / ef- / e- from Latin ‘out of,’ as in *exhale*, *exceed*, *exhume*, *expatriate*, *expire*, *exonerate*. The prefix forms *ef*- and *e*- before certain consonants, as in *effusive*, *emerge*, *elapse*, *erase*, *evade*, *escape*, *educate*, etc. Words like *ex-lover*, *ex-husband*, *ex-boxer*, *ex-president*, etc., indicating people who ‘used-to-be’ something, are also from this prefix.
- **extra**- from Latin for ‘beyond,’ as in *extraordinary*, *extra-special*, *extra-marital*, *extra-curricular*, *extravagant*, *extraneous*, etc. In many of its hyphenated constructions it act as ‘intensifier’ meaning ‘very’: *extra-large*, *extra-bright*, etc.
for- from OE preposition, usually meaning prohibition (forbid), abstention (forbear, forgo), or neglect (forsake, forget, forlorn).

fore- from OE ‘before’ or ‘in front,’ giving compounds such as forecast, foretell, forewarn, forefather, foregoing, forehead, forestall, etc.

hand- from OE, giving compounds such as hand-made, handwriting, hand-grenade, handshake, handbag, handkerchief, handcuffs, etc.

hyper- from Greek for ‘over’ or ‘above’ in the sense of ‘excessively,’ as in hyperactive, hyper-critical, hypersensitive, hyperinflation, hypertensive, hyperbole, etc. A prefix functioning as an intensifier, hyper- also functions nowadays as an independent word, meaning ‘agitated’ or ‘keyed up’: hype, hyped-up.

in- from OE preposition, giving compounds like insight, inbred, inlet, income, inhale, as well as endear, enthral, embed / imbed, engrave, etc.

inter- /intel-/enter- from Latin for ‘between,’ as in interact, intercontinental, intercourse, intermarriage, interview, interrupt, intercom, inter-city, internet, etc. Also: intelligent, entertain, enterprise, etc.

intra- from Latin ‘within,’ now used as an opposite of ‘extra,’ as in intra-European, intramuscular, intranet, etc.

intro- from Latin ‘to, towards’ or ‘within’: introduce, introvert, introspective, etc.

low- productive contemporary compound, giving low-key, low-profile, low-budget, low-grade, etc.

mid- from OE ‘middle’: midnight, midday, mid-week, mid-term, mid-semester, etc.

mis- partly from OE for ‘wrongly’ or ‘badly,’ and partly from Latin ‘minus’ via Old French mes, which came to have a similar meaning, giving misbehave, misjudge, misconstrue, mismanage, misspell, misplace, misdeed, mischief, etc.

out- from OE, giving compounds meaning ‘do better than’: outdo, outwit, outstrip, outmanoeuvre, etc. Others, such as outrage, outlaw, outside have the prefix stressed, and mean ‘outside of.’

over- from OE, giving compounds like overcome, overtake, overeat, overreact, overdo, etc.

un- from OE, meaning (1) ‘not’: unkind, unfair, unsound, unlikely, unimaginable, unwise, untrue, uncool, etc., and (2) ‘back,’ with the sense of ‘reversal’: undo, untie, unfold, unbend, etc.

up- from OE: upright, uptight, upriver, upfront, etc.

wel- /well- from OE adverb: welcome, welfare, well-bred, well-trained, etc.

with- from the OE preposition: withstand, withhold, withdraw, etc.

-dom OE abstract noun suffix, indicating (1) a state or condition: freedom, boredom, martyrdom, stardom, etc., and (2) a territory, as in kingdom, Christendom, etc.

-down English suffix giving (1) compound adjectives: face-down, nose-down, top-down, hands-down, head-down, etc., and (2) nouns: breakdown, crackdown, showdown, touchdown, meltdown, sundown, etc.
-en English suffix giving (1) diminutive nouns: chicken, kitten, maiden; (2) verbs denoting ‘making like (a quality)’: broaden, shorten, lengthen, sweeten, fatten, lighten, frighten, etc., and (3) adjectives indicating ‘substance’ something is made of: wooden, woollen, silken, golden, leaden, waxen, etc.

-ful English adjective suffix indicating: (1) quantity: handful, bagful, mouthful, spoonful, etc., and (2) characteristics: beautiful, awful, thoughtful, etc.

-head English noun affixed to other nouns, giving (1) a range of (usually pejorative) meanings: egghead, fathead, sleepyhead, paw-paw-head, dickhead, thickhead, etc. (2) indicating the top, or front of something: letterhead, masthead, spearhead, etc.

-ie / -y English diminutive suffix: baby, dearie, doggy, Annie, Johnny, sweetie, etc.

-ish English adj. Suffix indicating (1) 'diluted' quality: bluish, reddish, greenish, boorish, etc., or (2) nationality: Irish, British, Scottish, Turkish, Kurdish, etc.

-less English adjective-forming Suffix, indicating lack of (quality): timeless, priceless, sleepless, lawless, toothless, thoughtless, etc.

-like / -ly English adjective-forming suffix: bird-like, fin-like, warlike, lifelike, businesslike, heavenly, manly, lovely, saintly, orderly, fatherly, ghastly, etc.

-ly standard and most productive English adverb-forming suffix: quickly, surely, squarely, etc.

-most English adj. Suffix: topmost, uppermost, utmost, etc.

-ship English abstract noun suffix: friendship, hardship, scholarship, workmanship, etc.

-y Adj. Suffix: hairy, moody, bloody, guilty, greedy, guilty, etc.

The rules of ‘derivational’ morphology allow us to create a new word out of an old one. For example, the suffix –able, as in lovable, movable, pronounceable, huggable, etc., converts a verb meaning ‘to do X’ into an adjective meaning ‘capable of having X done to it.’

**Compounding**

In addition, English is very good at ‘compounding, which ‘glues’ two words together to form a new one. This word-combining process is very common in all Germanic languages (less so in their Romanic ‘cousins’): bookcase, fingerprint, armchair, wallpaper, car-park, underground, flyover, expressway, maybe, thunderstorm, blackout, therefore, forehead, weekend, eyeball, birthday, gridlock, toothbrush, standstill, go-slow, touchdown, shutdown, takeoff, cyberstalking, to mailbomb somebody, etc.

In English, a compound is often spelled with a hyphen, or as one word, but it can also be spelled with a space between the components, as in ‘no one,’ for example. There is a simple way to tell whether you have a compound or a
phrase: compounds generally have stress on the first element, and phrases – on the second. A *dark room* (phrase) is any room that is dark, but a *dark room* (a compound) is a photo lab. A *black board* (phrase) is a board that is black, but some *blackboards* (compound) are green, or even white. Pronounced wrongly (or written without punctuation marks) some word strings can be ambiguous:

Squad Helps Dog Bite Victim  
Man Eating Piranha Mistakenly Sold as Pet Fish  
Juvenile Court to Try Shooting Defendant

**Blending**

This is when we use two (or more) ‘pieces’ of different words and combine them into a ‘blend’ of both: *brunch* < breakfast+lunch  
*modem* < modulator-demodulator  
*breathealyzer* < breath+analyzer  
*electrocute* < electro+-execute  
*sitcom* < situation+comedy  
*slit* < slimy+lithe  
*televangelism* < television+evangelism  
*ginormous* < gigantic+enormous  
*Eurovision* < European+television  
*smog* < smoke+fog  
*motel* < motor+ hotel  
*glitzy* < glamour+ritzy  
*telecast* < television+broadcast  
*biodegradable* < biologically degradable  
*chortle* < chuckle+snort,  
*blog* < web log,  
*techsperts* < technical + experts,  
*flexting* < flirting + texting, etc.

Blending is popular with advertisers, with words like *informercials, twicicles, nicicles* and *Schweppervescence* 😊

**Clipping**

Clipping is a type of word formation which occurs when a word is abbreviated. The resulting terms are often colloquial, and found more often in spoken rather than written English (as the term suggests, ‘clipping’ means ‘cutting short’ the longer words). Who has the time to pronounce *laboratory*, when you can simply say *lab*? Or: *fax, bra, ad, gas, kilo, cab, perm, flu, porn, plane, pram, phone, synch* (in the phrase ‘to be out of synch with something’), etc. Names are also typically shortened: *Al, Kay, Ed, Dick, Mike, Ike, Tom,* etc.
There must be a ‘lazy bug’ present in educational environments, because here we see the blossoming of ‘clippings’: exam, typo, chem., gym, math, Prof, doc, uni, varsity, admin, circs: in / under the circs, no bull (for ‘no bullshit’), etc. Sometimes a whole phrase can be clipped: It shorted (it short-circuited), etc.

Amp < ampere
Bus < omnibus
Chimp < chimpanzee
Coke < cocaine, coca-cola
Demo < demonstration
Disco < discotheque
Fax < facsimile
Mob < mobile vulgus (< Latin: ‘the masses’)
Phone < telephone
Photo < photograph
Piano < pianoforte
Pram < perambulator
Pro < professional
Reps < representatives
Tacs < tactics (as in to ‘change tacs’)
Revs < revolutions
Spec < specification,
Blog < weblog, etc.

**Backformation**

Backformation is a process of forming a new word by removing an element from – rather than adding one to – an imagined root, or base. This is a specialized type of reduction process: typically, a word of one grammatical class (usu. a N) is reduced to form a word of another grammatical class (usu. a V): television → televise; donation → donate; option → opt; emotion → emote; enthusiasm → enthuse; liaison → liaise; babysitter → to babysit; psychology → to psych; obsession → to obsess (on sth.), etc. The word permutation has recently been observed attempting to backform a verb, permutate, when the verb has in fact existed for centuries, as permute (to backform is itself a backformation! 😊) A few other examples:

Automate < automation
Craze < crazy
Eavesdrop < eavesdropper
Vivisect < vivisection,
Sync < synchrony,
Psych (as in ‘psych someone up’), etc.
Nouns ending in ‘-er’ are often ‘backformed’ into verbs: burglars burgle; swindlers swindle; peddlers peddle; editors edit; sculptors sculpt, etc. – it stands to reason, doesn’t it? 😊

**Hypocorisms** are a special type of backformation, typical of British and Australian English. A longer word is usually ‘clipped’ to a single syllable, and then the diminutive suffix ‘-y’ or ‘-ie’ is added to the ‘tail’: telly, movie, Aussie, hankie, Barbie doll, bookie, cabbie, cookie, roadie, etc.

**Conversion**
Conversion is a term we use to name a word-formation process, which ‘converts’ words from one part of speech to another, i.e., when we use familiar nouns as words, or adjectives (without any reduction):

*He buttered his bread.*
*They import the wine in barrels, and bottle it here.*
*She likes to vacation in Australia.*

It’s expected to factor into that = it’s expected to impact the outcome

Conversion is particularly productive in modern English: Prices are bottoming/leveling out. They downned their beer in one long gulp. School party, sea air, user-friendly, vacation time, etc., etc. – in fact, the use of nouns as adjectives is becoming the norm!

**Acronyms**
Acronyms are abbreviations pronounced as if they were words, and they are a fairly recent method of word formation. They have proliferated particularly in the past 100 years. Acronyms are made up of the first letters of constituent words (they are shorter, simpler, and more user-friendly! 😊):

- CD for ‘compact disc’
- VCR for ‘video cassette recorder’
- MP for ‘Member of Parliament’
- AIDS for ‘auto-Immune Deficiency Syndrome’
- PIN for ‘personal identification number’
- ATM for ‘automatic teller machine’
- UFO for ‘unidentified flying object’
- laser for ‘Light Amplification by Stimulated Emission of Radiation’
- scuba for ‘self-contained underwater breathing apparatus’
- radar for ‘radio detecting and ranging,’
- DIME for ‘Dense Energy Metal Explosive’ (the new weapon Israel used in Gaza recently)
- Q2 for ‘second quarter,’ etc.
Note that the first set of examples are spelled out as capital letters, while the second set are written as ordinary words (one of the earliest acronyms is found in both forms: OK, or okay, meaning ‘ol korrekt’ 😊)

**Analogy**

Another, and much more productive, method of word formation is **analogy**, one of the driving forces of linguistic change. Many words and expressions are formed in this way, whether you describe a boring person as ‘*underwhelming*’ by analogy with ‘overwhelming,’ or say that a person has ‘*hidden shallows*’ by analogy with ‘hidden depths,’ or coin words like *motorcade* by analogy with *cavalcade*, *technobabble* by analogy with ‘nukespeak,’ *etopia* by analogy with ‘utopia,’ or *telethon / cleanathon* by analogy with ‘marathon.’ Some people, wanting to show off, extend the use of Latin affixes to new forms by analogy, i.e., *religiosity, criticality, systematicity, randomicity, insipidify, optimality, stereotypy*, etc. Such words have an air of heaviosity and seriosity about them, which clouds their meaning (a tactic used frequently by unscrupulous bureaucrats and politicians). 😊

Analogy is also used for humorous precision, not pomposity. Look at these items from *The New Hacker’s Dictionary*:

- **ambimoustrous**: capable of operating a mouse with either hand
- **barfulous**: quality that would make anyone *barf*
- **bogosity**: the degree to which something is *bogus*
- **depeditate**: to cut the feet off (e.g., while printing the bottom of a page)
- **dimwittery**: example of a dim-witted statement
- **geekdom**: state of being a techno-nerd
- **marketoid**: member of a company’s marketing department
- **mumble**: the topic of one’s mumbling
- **pessimal**: the opposite of ‘optimal’
- **wedgitude**: the state of being wedged (stuck; unable to move without help)
- **wizardly**: pertaining to expert computer programmers

**Coinage**

Because of so many other ways in which we can form new words, coining, or the *invention* of completely new terms is rather rare in English. Some words, however, like *aspirin, hoover, nylon, kleenex, xerox*, etc., that began as invented trade names, were quickly absorbed into the language and became common words that we use every day. With the IT revolution, so many new concepts entered our reality that new terms had to be invented for many of them, i.e., *kerning* (adjusting the spacing between the letters, so they look better), *modem* (short for Modulator-DEModulator), *dingbats* (a font consisting of graphical symbols), *website, weblog/blog*, etc.
Reduplication
Here words are created by partial or complete repetition (reduplication is particularly common among children): *bracadabra, puff-puff* (for train, in the days of steam engines), *wee-wee, teeny-weeny, bye-bye, tom-tom, tut-tut, tick-tock*. Many words formed this way have contrasting sounds, i.e., *hanky-panky, helter-skelter, okie-dokie, hocus-pocus, knick-knack, mish-mash, ping-pong, mumbo-jumbo*, etc. Most of these reduplicative words rhyme – that is what makes them memorable:

<table>
<thead>
<tr>
<th>Rhyming</th>
<th>Non-rhyming</th>
</tr>
</thead>
<tbody>
<tr>
<td>arty-farty</td>
<td>hi-fi</td>
</tr>
<tr>
<td>backpack</td>
<td>hoity-toity</td>
</tr>
<tr>
<td>Delhi belly</td>
<td>namby-pamby</td>
</tr>
<tr>
<td>easy-peasy (-japaneasy)</td>
<td>pub grub</td>
</tr>
<tr>
<td>fat cat</td>
<td>silly-billy, willy-nilly, etc.</td>
</tr>
<tr>
<td></td>
<td>dilly-dally</td>
</tr>
<tr>
<td></td>
<td>ding-dong</td>
</tr>
<tr>
<td></td>
<td>singsong</td>
</tr>
<tr>
<td></td>
<td>shilly-shally</td>
</tr>
<tr>
<td></td>
<td>flimflam, flip-flop</td>
</tr>
</tbody>
</table>

Repetative: *gaga, goo-goo, go-go, so-so, chin-chin, chop-chop, lik-lik, singsing, toktok, mu-mu* etc.

Multiple Processes
Thanks to all these word formation processes, the number of possible words we can build out of ‘pieces’ of words is immense. What makes their number infinite, is the fact that morphological rules can function together to create complex 3-D structures, not simple chains of morphemes stuck together. Remember?

The output of one morphological rule can be the input to another, or to itself: We can talk of *unmicrowaveability* of some ‘Liberty’ fries, a *floppy disk drive slot feature availability* in some computers, or a *get-down-to-business speech*, etc.

More often than not, several word-formation processes are at work:

- *delicatessen* → *deli* (borrowing + clipping);
- *snow + ball* → *to snowball* (compounding + conversion),
- *web+ log* → *blog* (clipping + blending), etc.

This is another example of how grammar functions as a complex mechanism tailored to the transmission of propositional structures through a *serial interface*.

Borrowing (using words from other languages)
This is one of the simplest kinds of word formation: the word is simply ‘lifted’ from another language. Over 70% of all the words in the Miriam-Webster Unabridged Dictionary are borrowed from other languages (majority from Old
French, Latin and Greek). The new word may be needed in English, because it describes something not previously known to English speakers. That is how the names of exotic plants and animals came into English: orange, lemon, paprika, avocado, yam, yak, kangaroo, pelican, etc. Walter Scott popularized in his novel *Ivanhoe* the realization that while many animals in their lifetime have English names (*ox, cow, calf, sheep, swine, pig, boar, deer*), they reach our table with French names (*beef, veal, mutton, porc, bacon, venison, brawn*, etc.). This is a relic from the time when Norman masters left the care of the living animals to the Anglo-Saxon lower classes, while the superior French *cuisine* was kept in the hands of Norman cooks and *chefs*. Many other borrowings testify to this superiority: *sauce, boil, fry, roast, toast, pastry, soup, sausage, jelly, dainty*. And while the humbler *breakfast* is English, the more sumptuous meals, *dinner, supper, and feasts* generally, are French. Most of these borrowings date from the Norman Conquest (1066 AD) and are no longer perceived to be foreign. We tend to be more aware of more recent borrowings, such as *glasnost, perestroika*, etc.

**Loanwords** are words that exist in one language and are imported into another language. Examples:

⇒ *bature* is a Hausa word for a ‘white man’ (*baturia* – a ‘white woman’), along with numerous other Hausa words, are used extensively in Nigerian English

⇒ the words *tai tai* ‘wife’ and *gweilo* ‘foreigner’ were imported directly from Cantonese into Hong Kong English

⇒ *bilum* – which language does it come from? 😊 - is part of PNG English, as are *tokples, toksave*, etc.

As we know, *borrowing* is one of the most common sources of new words in English. English has ‘soaked up’ numerous loanwords from a multitude of languages through contact with other nations and cultures: *alcohol* (Arabic), *boss* (Dutch), *robot* (Czech), *yoghurt* (Turkish), etc. Here are a few other examples:

**Dutch**: *apartheid, bluff, brandy, bully, bumpkin, clamp, coleslaw, commando, dope, drill, sledge, slim, snoop, spook, spoor, stoop, trek, golf, frolic, yacht*, etc.

**German**: *frankfurter, hamburger, hamster, waltz, quartz, schnitzel*, etc.

**Norse** and the Scandinavian languages: *anger, blink, bloom, blunder, blur, crook, die, dirt, doze, dregs, egg, fellow, gaze, geyser, law, leg, meek, muck, nasty, odd, roof, scold, sky, slalom, sniff, squeal, take, kick, weak, ugly, want, window*, etc.
Indian languages: mango, bungalow, dungarees, crimson, nirvana, pariah, sapphire, shampoo, sugar, swastika, yoga, etc.

Russian: [tok jou] < talk show, [bai] < Bye!, etc.

A loan-translation, or calque, is a special type of borrowing, which translates a foreign word, phrase, or idiom and adopts its meaning: French un grate-ciel → sky-scraper, English ‘boyfriend’ → Japanese boyifurendo (borrowing with sound modification), but a calque in Chinese: nan pengyu. [oxota na ved’m] is the Russian calque of ‘witch hunting,’ meaning ‘hunt for witches’, [jok i tręk’et] < ‘shock and awe,’ [os’ zla] < ‘axis of evil,’ [avia jou] < air show (here we have a calque + borrowing), etc.

Summary

1. Morphemes are the smallest meaningful units of language:
   a. They cannot be subdivided
   b. They add meaning to a word
   c. They are ‘recyclable’
   d. They can have any number of syllables

2. Our mental dictionaries contain morphemes and instructions for combining them.

3. Morphological rules can create complex three-dimensional structures: this makes the number of possible combinations infinite.

4. Bloomfield’s definition of word as a minimum free form is not always useful, because
   a. Words may be bound too tightly with their context (Cf. set phrases/idioms), or
   b. They can be homonyms/homophones – they can actually belong to different lexical items.

5. Word sound sequences are distinguished by uninterruptibility and mobility.

6. Morphemes can be isolated through comparing sound sequences.

7. Morphemes can be free or bound; free morphemes can be lexical or functional, and bound morphemes can be inflectional or derivational.

8. Two different types of morphemes act as building blocks that make up English words – Roots and Affixes. Each of these classes can be further subdivided:
   a. Roots can be free or bound
   b. Affixes can be divided into prefixes and suffixes
      i. Infixed and circumfixes may be common in other languages
Self-Assessment Exercises

Q 1  What is a word? How do you know?

Q 2  What’s a word in a foreign language? How do you know?

Q 3  More than one process was involved in the formation of each of the forms below. Can you identify them?

a. I have a new car-phone.
b. John wants to be a footballer.
c. The negotiators blueprinted a new peace proposal.
d. Another carjacking has been reported.

Think of 5 examples of multiple word formation processes at work.

Q 4  Identify the affixes in:

Unfaithful, carelessness, refillable, disagreement, scholarship, referee, impossible, scholarship, clearly, thankfully, unprecedented, disinterested, pleasant, nation, increment, exploding, interpreter, international, handbook and increasingly

Analyse 10 words of your choice.

Q 4  Identify affixes in these Nali (Manus) utterances; give their meanings, and say whether they are prefixes, suffixes, infixes or circumfixes:

<table>
<thead>
<tr>
<th>Nali</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>maran</td>
<td>his/her eye</td>
</tr>
<tr>
<td>moro</td>
<td>my eye</td>
</tr>
<tr>
<td>maram</td>
<td>your eye</td>
</tr>
<tr>
<td>poyo</td>
<td>my head</td>
</tr>
<tr>
<td>payam</td>
<td>your head</td>
</tr>
<tr>
<td>imo</td>
<td>my arm</td>
</tr>
<tr>
<td>imam</td>
<td>your arm</td>
</tr>
<tr>
<td>ndriko</td>
<td>my leg</td>
</tr>
<tr>
<td>ndrikam</td>
<td>your leg</td>
</tr>
<tr>
<td>ndrikan</td>
<td>his/her leg</td>
</tr>
<tr>
<td>ndrio</td>
<td>my stomach</td>
</tr>
<tr>
<td>ndriam</td>
<td>your stomach</td>
</tr>
<tr>
<td>ndrian</td>
<td>his/her stomach</td>
</tr>
<tr>
<td>seu(a)tou</td>
<td>my house</td>
</tr>
<tr>
<td>seu(a)tam</td>
<td>your house</td>
</tr>
<tr>
<td>seu(a)tan</td>
<td>his/her house</td>
</tr>
<tr>
<td>seu tahu</td>
<td>their house</td>
</tr>
<tr>
<td>seu torou</td>
<td>our house</td>
</tr>
<tr>
<td>seu tawawu</td>
<td>your (pl.) house</td>
</tr>
<tr>
<td>payatou</td>
<td>our head</td>
</tr>
</tbody>
</table>
Q 5  What word-formation processes can you identify in the sentences below? Give your own examples.

- When I am ill, I want to see a doc, not a vet.
- I was a deejay before, but now I am an emcee in a nightclub.
- That’s a-whole-nother problem!
- He is always taking pills, either uppers or downers.
- Live reporting is very popular nowadays, so we bring you Jenny – live!

Q 7  How do you form new words? How do you know how to?

Q 8  Do a complete morphological analysis of the following utterances from the Maninka language; fill the blank spaces with the proper Maninka forms:

<table>
<thead>
<tr>
<th>English</th>
<th>Maninka</th>
<th>English</th>
<th>Maninka</th>
</tr>
</thead>
<tbody>
<tr>
<td>bugo</td>
<td>‘hit’</td>
<td>bugoli</td>
<td>‘the hitting’</td>
</tr>
<tr>
<td>dila</td>
<td>‘repair’</td>
<td>dilali</td>
<td>‘the repairing’</td>
</tr>
<tr>
<td>don</td>
<td>‘enter’</td>
<td>donni</td>
<td>‘the entering’</td>
</tr>
<tr>
<td>dumu</td>
<td>‘eat’</td>
<td>dumuli</td>
<td>‘the eating’</td>
</tr>
<tr>
<td>gwen</td>
<td>‘chase’</td>
<td>gwenni</td>
<td>‘the chasing’</td>
</tr>
<tr>
<td>da</td>
<td>‘lie down’</td>
<td>dali</td>
<td>‘the lying down’</td>
</tr>
<tr>
<td>famu</td>
<td>‘understand’</td>
<td>famuli</td>
<td>‘the understanding’</td>
</tr>
<tr>
<td>men</td>
<td>‘hear’</td>
<td></td>
<td>‘the hearing’</td>
</tr>
<tr>
<td>sunogo</td>
<td>‘sleep’</td>
<td></td>
<td>‘the sleeping’</td>
</tr>
</tbody>
</table>

Q 9  Assess the following statements as ‘True’ or ‘False’:

1. A word is always bigger than a morpheme.
2. Affixes are bound non-roots.
3. A morpheme is the smallest possible unit of meaning.
4. The word ‘unrealistically’ contains 4 morphemes.
5. The plural ‘-s’ is a derivational morpheme
6. The ending ‘-ly’ is a functional morpheme
7. The suffix ‘-ment’ is an inflectional morpheme
8. ‘Flamingo’ is a free lexical morpheme.
9. ‘-ful’ is a bound derivational morpheme.
10. ‘Pregnant’ is made up of 2 morphemes.

Q 10  Identify word formation processes at work:

Decentring, universalists / substratists, to input data into computer system, interactional processes, systematicity, describably, stick-to-its-ness, webisodes.
